Abstract

A frame border corner connecting device for interconnecting a pair of selectively lockable frame border strips of a changeable frame so as to thereby form a corner of the changeable frame is provided. The frame border corner connecting device includes a base element having respective sides to which each one of the frame border strips is securable. The frame border corner connecting device also includes a corner cover element movably mounted to the base element for movement between an open position, in which the corner cover element is clear of the path of movement of an item being moved selectively into or out of the changeable frame, and a closed position in which the corner cover element extends at least partially into the path of movement of the item.
